

Neonatal and Paediatric transport course

High-fidelity simulation scenarios

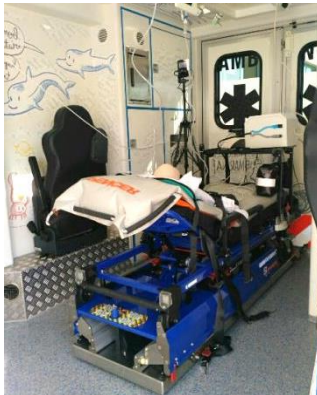

If you are interested in the transport of high-risk neonatal and paediatric patients, either because you are currently working in a transport team or may do so in the future

If you want to improve your skills in the management of the critically-ill paediatric and neonatal patient in a safe environment

If you would like to develop your communication, task management, situational awareness, decision-making and leadership skills

If you would like to learn how to define the organisation of a neonatal and paediatric transport system

If you would like to exchange ideas, experiences and knowledge with other colleagues who work in the same field as you

The neonatal and paediatric transport course with high-fidelity simulation scenarios gives you the opportunity to develop your skills in the transport of high-risk neonatal and paediatric patients, allowing an exchange of experiences, ideas and knowledge with other participants from around the world.

It will also enhance your performance in critical situations through the skills acquired in crisis resource management in a multidisciplinary environment.

The course will focus on the key principles of crisis resource management: communication, task management, situational awareness, decision-making and leadership; using high-fidelity simulation scenarios which allow you to apply your knowledge in the identification and stabilisation of the critically-ill patient in a safe environment.
